# **SEDIVER**

Sediver® toughened glass insulators for HVAC applications

## Sediver, Experts and pioneers in insulation technology

With 70 years of experience and investment in R&D, Sediver has gained uncontested expertise in research, design, manufacturing and testing of insulators for power networks up to very high voltages and for railway catenary systems. Sediver is the partner of choice for all insulation applications.

### Our expertise

- > 500 million toughened glass insulators installed in more than 150 countries on lines up to 1,100 kV AC,
- > 6.5 million toughened glass DC insulators installed up to 800 kV,
- > 5 million composite insulators on lines up to 735 kV,
- > 2 million Sedicoat insulators, silicone coated toughened glass insulators for both AC and DC applications.

### Research & Development, a permanent and continuous investment

Always on the lookout for continuous technological improvements, Sediver heavily invests in Research and Development. Our research and testing facilities as well as our high voltage CEB laboratory both located in France boast state-of-the-art equipment that allows extensive research programs as well as testing of complete strings for systems up to 800 kV.

### Worldwide presence – reinforced proximity

### Unique manufacturing processes

Sediver manufacturing processes are unique in the world.

These processes have been developed and improved thanks to the experience Sediver has gained over the years following-up and assessing the performance of millions of insulators in service as well as through the integration of the latest technological advances.

Our goal: your satisfaction through the reliability of our products on your lines.

### Sediver, our experts at your service

### In-depth technical expertise

Our team of multidisciplinary and highly skilled engineers is dedicated to the research and development of optimum solutions in the field of high-voltage insulation and protection.

### Innovative products

Our engineers and scientists are always searching for new materials, products, designs and technologies that will contribute to improve the performance and the reliability of your systems while reducing the environmental impact.

### Sediver technical assistance

Our technical assistance teams help you throughout all the stages of the insulation related matters from the selection of the optimum insulation solution to the monitoring of performance in service.

We offer specifically:

- Testing and evaluation programs
- Joint research programs related to solving insulation issues
- Training programs dedicated to design, handling and maintenance teams
- End-of-life and failure diagnostics

### Dedicated research and testing facilities

The equipment and facilities of our 7 research and testing centers ensure the development of insulators with excellent long term behavior and performance.

- Investigation of materials and their behavior in service:
   Vital to ensure a high level of performance and reliability of our insulators
- Mechanical endurance testing:
   Essential to designing insulators with excellent long term behavior under extreme service conditions
- Evaluation of the insulators' electrical performance: Fundamental to assess the performance of any type of insulator string configuration
- Determination of the pollution performance of insulators and strings:

Critical for the choice of the right insulator adapted to each specific environmental condition

## Sediver®'s unique manufacturing processes

The Sediver design and manufacturing processes have been developed over the past 70 years, taking advantage of millions of insulators supplied and the evolution of new technology, with always the same goal in mind: your satisfaction.

### Sediver®'s unique processes

#### Glass composition and melting

Sediver® glass is obtained through a unique melting process based on the use of a specific furnace technology and proprietary Sediver manufacturing process control and parameters.

The technology developed by Sediver:

- Ensures an outstanding homogeneity in the chemical composition of the glass
- Provides high purity glass without heterogeneity.

#### Moulding

Our unique know-how enables us to create complex glass shapes and products up to 420 mm in diameter and weighing more than 10 kg.

#### Toughening

The toughening process developed by Sediver generates a permanent compressive pre-stress on the surface of the glass shells which confers to the glass:

- high mechanical strength
- high resistance to thermal shocks and mechanical impacts
- immunity to the effects of aging.

Thanks to the toughening, the behavior of the dielectric shell becomes binary:

- 1) either the glass is intact: no possible internal cracks nor puncture
- 2) or the glass is shattered: the glass is no longer visible outside the metal cap (stub).

#### Assembly of the glass shell with metal fittings

The assembly of Sediver® glass insulators is done by a specific hot curing process, using a chemically inert cement (high strength aluminous cement).

Thanks to this process our insulators offer:

- outstanding mechanical stability over time
- residual mechanical strength close to that of a complete insulator if dielectric shell happens to be broken.

## Systematic control and inspection of the insulators during manufacturing

Guaranteed quality thanks to continuous inspection and control of the production lines

- All glass shells undergo specific and repeated thermal shocks and successive quality controls so as to eliminate pieces that could present defects
- All insulators are subjected to stringent quality inspection by automated systems.

The entire process is constantly monitored by highly qualified inspectors.

#### Users' benefits

#### **Appropriate solutions**

Thanks to the different shapes of the glass shells and to mechanical strengths ranging up to 840 kN, Sediver offers solutions adapted to all applications and the most varied environmental conditions.

### Easy installation, inspection and detection

As Sediver® glass insulators are very resistant to mechanical shocks, the stringing and line construction is much easier while the number of accidentally damaged insulators is significantly lower than with porcelain insulators. As the detection of any damages during installation is evident and immediate, the risk of installing a damaged unit is non-existent.

#### Reduced inspection and maintenance costs

- Unlike other materials, such as porcelain or composites, a quick and easy visual inspection is enough to identify the state of the toughened glass insulators and this without any possible mistake. The inspection costs are thus reduced to a minimum throughout the life cycle of the line.
- Sediver® toughened glass insulators are unpuncturable and resistant to overvoltage stresses thanks to a defect-free dielectric body and the homogeneity of the glass shell.
- The shattering rate of glass shells in service is negligible thanks to the high purity of Sediver® glass.
- The residual mechanical strength of Sediver® glass insulators remains almost unchanged compared to an intact insulator thanks to unique hot cured aluminous cement assembly process. Therefore, there is no urgency to replace an insulator with a broken glass shell.
- Optimum safety for live line working.

#### **Extended life**

The life time of Sediver® glass insulators exceeds the life time of the conductors, hardware and structure. Since they do not age, there is no need to replace the insulators during the life of the line.

#### Reliability, traceability

As Sediver® technology and quality are homogenous throughout all its production sites, we can therefore guarantee full consistency of performance worldwide. Each insulator is marked with the manufacturing plant's identification code and the production batch.

The marking allows total traceability.

## Sediver® insulators: more than a standardized insulator

The design of Sediver® insulators is not limited to complying with the minimum requirements of the applicable standards, but is based on requirements for a higher level of performance in service which in turn, reduces the operating cost of the line.

### Users' benefits in choosing Sediver® glass insulators

| Type of test | Test description                           | Criteria<br>IEC 60383-1  | Sediver® criteria   | Benefits for the user   |

### Dielectric shell profiles

Throughout decades, Sediver® engineers have developed and designed different types of insulators adapted to all kinds of climates and environments, such as described in the IEC 60815-1 standard.

#### Standard profile:

The standard profile is characterized by a leakage distance\* higher than the values indicated in the IEC 60305 for standard insulators and by shallow and well-spaced under-ribs that allow an effective self-cleaning action by wind or rain. It features a "leakage distance/spacing" ratio of around 2.2 and is particularly effective in suspension and tension applications in very light to medium polluted areas where typically the pollution level (ESDD) is lower than 0.1 mg/cm2. (Examples: zones E1 to E4).

\* or creepage distance

#### Fog type profile:

The fog type profile is characterized by long and widely-spaced under-ribs so as to avoid arc bridging between adjacent ribs. It features a « leakage distance/spacing » ratio of around 3.2 and is particularly effective in coastal areas (Salt fog) as well as in polluted areas where a higher specific leakage distance is required. (Examples: areas E5 to E7).

#### Open profile:

The open type profile features a « leakage distance/spacing » ratio of around 2.4, with no under-ribs so as to avoid the accumulation of solid pollution deposits (dust, sand) on its lower surface. It is particularly adapted to suspension and tension applications in desert areas where wind is predominant and rain infrequent.

### **Spherical profile:**

The spherical shape offers a leakage distance equivalent to that of standard profile type. With a spherical profile, manual cleaning is easy and effective.

### External shed profile:

This profile offers a leakage distance equivalent to the anti-pollution profile and is adapted to the most extreme cases of solid pollution.

The elimination of the under-ribs reduces pollution build-up, promotes self-cleaning and facilitates manual cleaning when necessary.

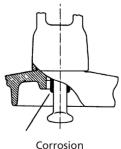

#### Corrosion prevention solutions

#### Corrosion prevention sleeve

In severely corrosive marine and industrial atmospheres, the galvanized coating on suspension insulator pins may deteriorate over time and be followed by corrosion of the pin itself. To prevent this form of pin damage, Sediver can supply insulators equipped with a corrosion retardation sleeve made of high-purity zinc. The insulators are then designated by "DC" (F100P/146 with zinc sleeve becomes F100P/146DC).

### **Heavy galvanization**

All Sediver® ferrous metal fittings are hot-dip galvanized. IEC 60383-1 and ASTM A153-82 require a zinc coating mass of 600/610 g/m² corresponding to a thickness of 85/86  $\mu$ m. In severe conditions, where this standard protection is known to be insufficient, Sediver offers enhanced protection of the cap and the pin by increasing the thickness of zinc to 110  $\mu$ m, or up to 125  $\mu$ m.

prevention sleeve

For specific insulators not presented in this catalogue, or for specific applications such as extreme pollution areas or direct current, please contact us.

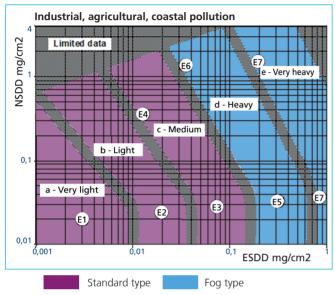

### Selection criterion

### Choice of the insulator profile

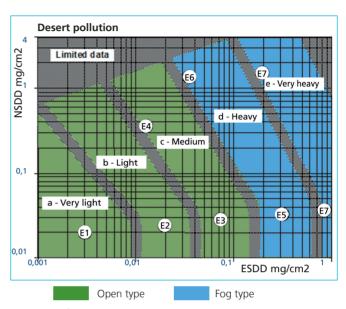

The IEC 60815-1 standard defines 5 levels of pollution according to the pollution severity:

very light, light, medium, heavy and very heavy.

The levels of pollution are defined according to the Equivalent Salt Deposit Density (ESDD) and the Non-Soluble Deposit Density (NSDD) on the surface of the insulator.

In the case of industrial, agricultural and coastal pollution: Sediver® recommends the use of the standard profile in very light, light and medium polluted areas and the fog type profile in heavy and very heavy polluted areas.

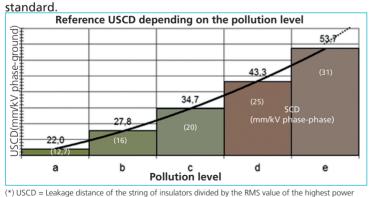

In the case of desert pollution:

Sediver® recommends the use of the open profile in very light, light and medium polluted areas and the fog type profile in heavy and very heavy polluted areas.

### Choice of insulation

The number of insulators per string depends on the maximum voltage of the transmission line and the pollution severity of the region.

It should be calculated in accordance with the specific creepage distance (USCD\* or SCD\*\*) as defined by the IEC 60815-2

( ) OSCD = Leakage distance of the string of insulators divided by the RNIS value of the highest power frequency voltage seen by the string (phase - ground). (\*\*) SCD = USCD  $/\sqrt{3}$ 

String dimensioning example:

For a 230 kV line,

(Max. phase-ground voltage: 245 /  $\sqrt{3}$ )

located on the coast in a heavy pollution level

(ESDD>0.1mg/cm², pollution level = d)

Selected insulator: F120P / 146

(fog type profile with 445 mm leakage distance)

Total leakage distance needed:

■  $43.3 \times 245 / \sqrt{3} = 6125 \text{ mm}$ .

Number of insulators in the string:

■ 6125 / 445 = **14** insulators.

In cases of extreme pollution when regular washing of the insulator strings becomes necessary, Sediver® offers Sedicoat®:

Sediver® silicone coated toughened glass insulator (see page 23)

## For extreme pollution: Sedicoat® solution

In case of extreme or exceptional pollution, it may become necessary to wash the glass and porcelain insulators so as to reduce the risk of flashover due to the critical deposit of pollution. Composite insulators can be used in these conditions, nonetheless the benefits linked to the hydrophobicity and profile of this kind of insulators are outweighed by the difficulties of inspection and diagnosis of the aging as well as the difficulty of live line working.

### Sedicoat®: no washing is needed anymore

Sedicoat® insulators are Sediver® toughened glass insulators coated with silicone. The silicone coating procures hydrophobic properties to the surface of the glass shell and thus significantly enhances its electrical performance under extreme pollution. The hydrophobic behavior of the surface helps mitigating extreme pollution problems by reducing wetting and leakage currents.

Sedicoat® insulators offer a solution that eliminates the need for regular washing in extreme pollution conditions.

### A Sediver R&D qualification program

The performance and lifetime of silicone coatings depend on the silicone type, the adherence of the silicone layer to the glass shell, the thickness and the homogeneity of the coating.

To obtain optimum performance, Sediver® has set in place a stringent R&D program. The silicones qualified by Sediver® have been specifically selected to resist quite severe electrical constraints undergone by cap and pin insulators on overhead lines in polluted environments.

The application of the coating is done at the factory according to a specific industrial process qualified by Sediver.

## A solution confirmed by 2 decades of satisfactory service

### **Applications**

- Coastal areas
- Industrial pollution areas
- Desert areas
- Mixed pollution areas
- Applications in HVAC and HVDC

#### Main advantages:

- $\blacksquare$  Reduce the maintenance cost as there is no need for washing
- Keep the inherent properties of the toughened glass in terms of:
  - easiness and reliability of visual inspection
  - safe live-line working
  - long term electrical and mechanical reliability
  - no aging
- No need to modify line design
- Can be applied on all glass profiles

Sedicoat® is the solution that maintains the unique properties of Sediver® toughened glass insulators while eliminating the need for washing under extreme pollution conditions thanks to the silicone coating.

## IIEC/BS string electrical ratings

Sediver® toughened glass suspension insulators

### Open type profile

Open type profile suspension insulator string withstand voltages based on the test procedure of the International Standard IEC 60383-93 and British Standard BS 60383.

These electrical ratings are applicable to Sediver® suspension insulator strings not equipped with arcing devices or grading rings. According to the American Standard the average value of three tested strings shall equal or exceed:

<sup>95%</sup> of the guaranteed values as given in the data sheet, for low frequency dry flashover,

<sup>90%</sup> of the guaranteed values as given in the data sheet, for low frequency wet flashover,

<sup>92%</sup> of the guaranteed values as given in the data sheet, for critical impulse flashover.

## ANSI string electrical ratings

Sediver® toughened glass suspension insulators

### Fog type profile

Fog type profile suspension insulator string flashover voltages based on the test procedure of the American Standard ANSI C 29.1.

These electrical ratings are applicable to Sediver® suspension insulator strings not equipped with arcing devices or grading rings. According to the American Standard the average value of three tested strings shall equal or exceed:

www.sediver.com

<sup>95%</sup> of the guaranteed values as given in the data sheet, for low frequency dry flashover,

<sup>90%</sup> of the guaranteed values as given in the data sheet, for low frequency wet flashover,

<sup>92%</sup> of the guaranteed values as given in the data sheet, for critical impulse flashover.

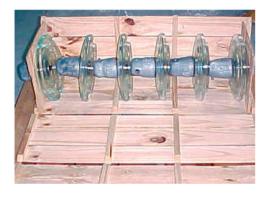

## Packing and palletization

### Reinforced and optimized packing

The packing and palletizing methods used by Sediver® result from the experience gained from the shipment of hundreds of millions of toughened glass insulators to users' warehouses and construction sites in 150 countries as well as from extensive tests performed by packing research organizations.

The packing methods described and illustrated below have been developed expressly to minimize any possible damage during shipment and storage.

The wood used for packing is either standard or treated according to country regulations or/and customer specification.

### Strengthened packing

Factory-assembled strings of Sediver® insulators are packed in wooden crates, which are reinforced and held closed by external wire bindings. A crate is shown here in the open position and is internally braced to permit stacking.

### Easy to open

External wire bindings are designed to keep crates firmly closed, and to allow easy and quick opening at time of installation with no need for special tools.

#### Maximum protection

Crates are evenly stacked on a sturdy four-way wooden pallet. This assembly is held tightly in place with either steel or plastic bands and is protected against moisture by a complete covering of polyethylene film.
